

XELA SECURITY SERVICES

Xela® Professional Services guides our customers in securing their devices. Our team is highly experienced and successful in the security field that spans critical infrastructure market segments including aerospace, defense, industrial, and networking.

XELA SECURITY FRAMEWORK

Xela Professional Services has a security offering that includes a compendium of security implementations based on the industry standard confidentiality, integrity, and availability (CIA) triad. Xela's Security Framework is the foundation for security solutions that Professional Services offers its customers as it defines how a device is secured. An overview of the Xela Security Framework is shown in Figure 1.

SECURITY ASSESSMENT

Professional Services works closely with the customer to understand their system and operational requirements while systematically determining the assets, the vulnerabilities to those assets, and required security implementations to protect those assets. Professional Services develops the security assessment in collaboration with the customer to ensure alignment and practicality. The output of the assessment is a comprehensive report containing:

- Baseline security definitions to ensure commonality of terms used
- Itemized list of assets and vulnerabilities
- Security policy defining what is meant to protect each asset of the system
- Security implementation considerations with specifics on instantiated security implementation as it applies to the overall system and operational environment
